What it does

- **One place for everything.** Audiobooks, ebooks, print books and podcasts on the same shelves, synced across devices.
- **Brings your history with you.** Imports from Goodreads, Audible, Kindle, Libby, Apple Books, Apple Podcasts, Spotify, StoryGraph, hoopla and 30+ other apps.
- **Picks that learn your taste.** Based on everything you've finished and loved, across every app, with a reason on every pick. They also stretch your taste instead of repeating it.
- **Listen Together.** Rooms where friends and book clubs read or listen to the same book, with a spoiler shield that hides anything ahead of where you are, and live sessions.
- **Every series in order.** What you've finished, what's next and what's coming, with one tap to queue the rest.
- **Free first.** Shows when a book is free at your library before any store price, and never tries to sell you a book you already own.
- **Alerts that matter.** When a wanted book is free at the library, a series continues, an author has something new or a price drops. Never more than one email a day.
- **Private by default.** Picks are worked out on your own device. Reviews and notes stay private.

Why it exists

Avid readers spread their reading across many apps: one for audiobooks, one for ebooks, one for tracking, one for podcasts. None of them sees the whole picture, so recommendations only know a slice of your taste, people buy books they could borrow, and series get lost. Audiostacks brings it all together.
